## Description

The dole drill is a machine mounted on a three-point linkage (RUP), designed to work with agricultural tractors of 0.6 ÷ 0.9T class. The drive is transmitted via the PTO shaft of the tractor. The drill is used to drill holes in the ground when planting fruit trees and bushes, etc. There is a possibility to drill deeper holes, which allows to use the device when setting fence poles, rows, etc. The machine drills holes in the ground vertically up to 65 cm with a ø50 cm drill diameter and up to 100 cm deep with a ø25 cm drill diameter. By adjusting the speed of the roller (PTO) we can set the width of scattered soil when drilling holes. For the auger, it is recommended to use a power relay fight with a breakaway fuse or a 250 Nm friction clutch, e.g. LFMR C 40970.

- verticality of the drill
- two drills in the set
- possibility to mount a screwing anchors attachment
- possibility to install drills with different diameters
