Description

The rotating, double brush, like the previous one, is designed for the care of cattle and pigs. It provides animals with the best massage, improving their welfare, which in turn translates into increased milk yield and weight gain of the animals. The use of two brushes increases the range of massaged parts, ensuring the animals' cleanliness and good health. In addition, the brushes rise to the height of the animals. The drive uses a 370 W gear motor, controlled by microprocessors. Microprocessors make it possible to adjust the brush operation time, change the direction of rotation at each start, which ensures long-term durability of the device. height width length 140 cm 39 cm 122 cm
