Description

Metal-Technik Meadow leveller

A tillage tool used for fibring.

It levels the soil surface, crushes crusts formed in winter, compacts the soil, destroys small germinating weeds.

Folded manually or hydraulically – width 4, 5, 6 or 8 meters – it is designed for the care of meadows, pastures, as well as for fibering arable fields after winter. The levellers are also used for the care of stubble ploughing and pre-sowing crops.

Irreplaceable for leveling molehills in meadows.

The leveller is made of a frame and a mesh consisting of toothed, cast iron working elements connected to each other and to the frame by steel wheels. The segments of the leveller are connected by special hinges to ensure stability during operation and transport.

The leveller nets are equipped with working elements with a double-sided application: the toothed side is used to ventilate grass surfaces, preventing felting and causing even growth; The smooth side is used for crushing soil clods, leveling and processing grassy surfaces.

New Improved m.in Design:

leveller field with higher tension – improved leveller efficiency due to greater pressure on the soil,

wider leveller area – larger working area,

stronger castings (teeth) – increased durability of the leveller field,

improved visual appearance,

new, more convenient tractor hitch – facilitates the transport of leveller,

possibility of galvanizing – protection against corrosion.
