Description

The strawberry mulching machine is a device that facilitates and accelerates the spring straw spreading procedure between rows of strawberries. The device through the use of a cutting rotor and three outlet channels allows spreading of crushed straw simultaneously in three furrows between rows. With the use of a bedding machine, straw after the season is easier to remove and biodegrades faster, while the bedding machine is definitely more economical than traditional straw spreading. The device is equipped with two folding platforms for collecting straw and additionally they can be equipped with support wheels protecting against overloading the tractor lift and stabilizing the machine.

- the machine is used to crush straw cubes
- possibility of blowing using 2 out 3 outlet pipes
- adjustable support wheels
- adjustable outlet pipes
- an innovative system for the regulation of the degree of straw fragmentation covered by patent protection
