Parameters

Name	Unit
Working width	2500 mm
Number of coulter	19 pcs
Capacity (liter)	443 l
Weight	450 kg
Minimum HP	48 hp
Drivegear	tractor PTO

Description

Universal seed drills Scorpius are available in widths of 2,5m - 2,7m - 3,0m - 4,0m. These are seed drills with traditional mechanical seeding system, with a simple, durable construction. The machines can be used on farms with small and medium areas, they are perfect for light and medium solid soils. Machine can be used independently or in combination with passive or powered machines for soil cultivation, during sowing after plowing or in mulch. A seed drill depending on the soil conditions, can be equipped with hoe coulters, single or double disc coulters. The seed hopper with a "V" shaped bottom ensures complete emptying of the seed material. The drive of the sowing units is via a drive wheels and a set of chain transmissions and a 60-position continuously variable transmission. The standard equipment is hydraulic disc markers, a platform for easy loading of the hopper and wheels' rippers. Disc coulters can be optionally equipped with wheels. The main task of wheels is to maintain proper seeding depth and soil compaction over the sown grain. Soil compaction results in better access to moisture especially on sandy soils, which is very important at spreading small-seed plants e.g. rape. This affects obtaining faster and more equal emergence of sown crops. The additional equipment may be technological paths electrically controlled.
