Parameters

Name	Unit
Weight	1650 kg
Working width	12000 mm

Description

Metal-Technik Weeder

The weeder is designed for mechanical weed removal in cereal crops.

It is also used to care for grasslands, accelerating regrowth and stimulating branching by raking the turf.

It is especially useful in organic farming.

The machine is made of a hydraulically foldable frame, supported by four gauge wheels with adjustable spacing during operation.

The weeder has spring tines made of wire with a diameter of 7mm.

The adjustable working height and tine rake angle allows the machine to be adapted to any crop.

The machine is equipped with lighting that allows safe movement on public roads.
