Parameters

Name	Value
Weight	50 kg
Working width	800 mm
Oil flow	30 l/min

Description

Hydraulic branch scraper is a device which is suspended by means of a bracket on a flail shredder, mower-chopper or mounted in front of the tractor. It has the task of scraping small branches from under the trees, which are then shredded by the aggregated machine. The scraper support is mounted on a hinge, which makes it possible to assemble it for transport. The height of the scraper propeller is determined by the height of the aggregated machine. When the scraper is mounted in front of the tractor, the height of the propeller is adjusted manually.

- angle adjustment
- rubber reinforced with springs
- flexible rubber segments
- possibility of aggregation for shredders
- optional mounting on three-point linkage
